

INFORMATION FLOW

System architecture is a conceptual model that defines the structure of a system. We focus on building multi-tiered system architecture to create secure and solid web-based applications. The diagram provides insight into the information transfer within the system.

Data storage

PostgreSQL is an open source database which is an object-relational database management system. It is cost effective, stable, secure and has transactional integrity.

Application environment

Node.js is a lightweight and efficient platform to build scalable network applications. Perfect for real-time applications.

User environment

HTML 5 is the intuitive and powerful front-end framework enabling for improved functionality and usability to users.
